5. Write a Python program using a keyword-based classifier that reads a description of a threat-intelligence report and its intended audience, and classifies it as Strategic, Tactical, or Operational.

```
[7]
✓ 30s

description = input("Enter report description: ").lower()
audience = input("Enter intended audience: ").lower()

text = description + " " + audience

strategic = [
    "business risk", "risk trends", "senior management",
    "executive", "long-term", "business impact"
]

tactical = [
    "attacker techniques", "tactics", "techniques",
    "indicators of compromise", "ioc", "malware methods",
    "security analysts"
]

operational = [
    "active incident", "incident response", "current attack",
    "security alerts", "soc team", "live threat"
]

strategic_score = sum(word in text for word in strategic)
tactical_score = sum(word in text for word in tactical)
operational_score = sum(word in text for word in operational)
```

```
[7]
✓ 30s

tactical_score = sum(word in text for word in tactical)
operational_score = sum(word in text for word in operational)

if strategic_score == tactical_score == operational_score == 0:
    result = "Unclassified"

elif strategic_score > tactical_score and strategic_score > operational_score:
    result = "Strategic"

elif tactical_score > strategic_score and tactical_score > operational_score:
    result = "Tactical"

elif operational_score > strategic_score and operational_score > tactical_score:
    result = "Operational"

else:
    result = "Unclassified - More information required"

print("Classification:", result)

...
Enter report description: Cyber risk trends and business risk
Enter intended audience: Senior management
Classification: Strategic
```
