6. Write a Python program to detect phishing URLs by checking a given URL against common phishing indicators (e.g., suspicious keywords, IP-based domains, excessive subdomains).

[8]
✓ 7s

```
from urllib.parse import urlparse
import ipaddress

url = input("Enter URL: ").strip()
check_url = url.lower()

if "://" not in check_url:
    check_url = "http://" + check_url

parsed = urlparse(check_url)
host = parsed.hostname or ""

score = 0
indicators = []

keywords = [
    "login", "verify", "account", "secure",
    "update", "password", "confirm"
]

if any(word in check_url for word in keywords):
    score += 1
    indicators.append("Suspicious keyword")
```

[8]
✓ 7s

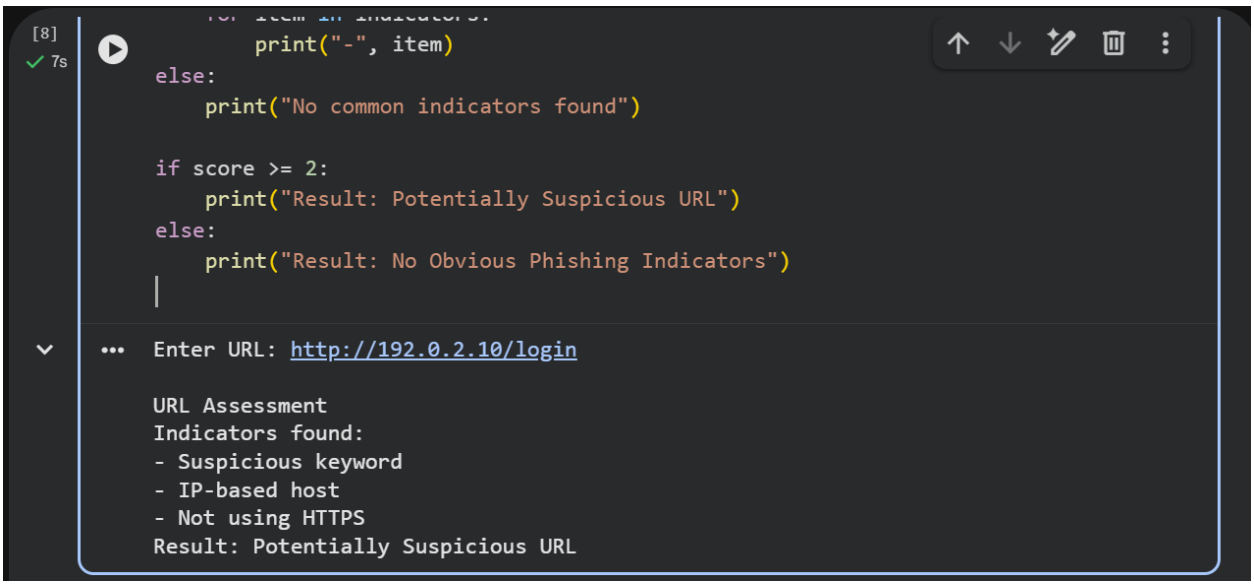

```
try:
    ipaddress.ip_address(host)
    score += 1
    indicators.append("IP-based host")
except ValueError:
    parts = host.split(".")
    if len(parts) > 4:
        score += 1
        indicators.append("Excessive subdomains")

if parsed.scheme != "https":
    score += 1
    indicators.append("Not using HTTPS")

print("\nURL Assessment")

if indicators:
    print("Indicators found:")
    for item in indicators:
        print("-", item)
else:
    print("No common indicators found")

if score >= 2:
    print("Result: Potentially Suspicious URL")
```

[8]
7s
print("-", item)
else:
print("No common indicators found")
if score >= 2:
print("Result: Potentially Suspicious URL")
else:
print("Result: No Obvious Phishing Indicators")
Enter URL: http://192.0.2.10/login
URL Assessment
Indicators found:
- Suspicious keyword
- IP-based host
- Not using HTTPS
Result: Potentially Suspicious URL
