**1. Write a Python program that reads a short business scenario and identifies the most relevant threat-intelligence application area for that industry context (e.g., banking fraud prevention, healthcare data protection, e-commerce fraud prevention).**

[1]
✓ 12m

```
scenario = input("Enter business scenario: ").lower()

if any(word in scenario for word in
       ["bank", "banking", "credit card", "transaction", "fraud"]):
    print("Threat Intelligence Area: Banking Fraud Prevention")

elif any(word in scenario for word in
         ["hospital", "healthcare", "patient", "medical"]):
    print("Threat Intelligence Area: Healthcare Data Protection")

elif any(word in scenario for word in
         ["shopping", "e-commerce", "online store", "online shopping"]):
    print("Threat Intelligence Area: E-commerce Fraud Prevention")

else:
    print("Threat Intelligence Area: General Cybersecurity")
```

```
Enter business scenario: A bank detects suspicious transactions and credit card fraud
Threat Intelligence Area: Banking Fraud Prevention
```
